# 2017 Michigan State University Spring Malting Barley Variety Trials 

Baas, D.; DeDecker, J.; Kapp, C.; McFarland, A.; Hardies, N.; and Wilke, B. With support from: MSU AgBioResearch, MSU Extension, the Brewers Association, and the Hardies Farm

This report outlines the data and results from Michigan State University's involvement in the Eastern Spring Barley Nursery (ESBN), led by North Dakota State University and funded by the Brewers Association. This multi-state collaborative effort facilitates simultaneous testing of spring malting barley varieties.

## ESBN Locations

1. MSU Upper Peninsula Research and Extension Center, Chatham MI (Alger County)
2. Hardies Farm, Hillman, MI (Alpena County)
3. MSU W.K. Kellogg Biological Station, Hickory Corners, MI (Kalamazoo County)

## Protocol

Twenty-five barley varieties were laid out in a rectangular lattice experimental design with three replications. All varieties were planted at a seeding rate of 28 seeds $/ \mathrm{ft}^{2}$. Plot edges and alleys were cut out before harvest for the purpose of eliminating edge effect. Harvested seed was cleaned in an A.T. Ferrell Eclipse fanning mill and the seed was processed through a
 Dickey-John GAC 2500 for test weight and grain moisture percentage. Yield was corrected for $13 \%$ moisture, and test weight was recorded in pounds per bushel. Seed was submitted for grain quality and malt analysis to the testing laboratory at North Dakota State University. Malt analysis was not performed on samples from Hillman due to the high incidence of pre-harvest sprout. Agronomic details and weather information for the plots are outlined in Table 1.

Table 1. Plot information and weather data for each trial location

|  | Chatham (UPREC) | Hillman (Hardies Farm) | Hickory Corners (KBS) |
| :---: | :---: | :---: | :---: |
| Soil Type | Eben Very cobbly sandy loam | Omena Fine sandy loam | Kalamazoo Loam |
| Previous Crop | Soybeans | Soybeans | Soybeans |
| Planting Date | May 10 | May 15 | April 18 |
| Fertility applied | 50 lbs N/ac | $50 \mathrm{lbs} \mathrm{N} / \mathrm{ac}$ | $50 \mathrm{lbs} \mathrm{N}, 100 \mathrm{lbs} \mathrm{P}, 50 \mathrm{lbs} \mathrm{K}$, 12 lbs S /ac |
| Herbicide applied | 13.5 ozs/ac Huskie | 13.5 ozs/ac Huskie | 12 ozs Huskie + 16.4 ozs Axial /ac |
| Fungicide applied | 8.2 ozs/ac Prosaro | 8.2 ozs/ac Prosaro | 8.2 ozs/ac Prosaro |
| Insecticide applied | NA | NA | 2.32 ozs/ac Grizzly Z |
| Harvest date | August 21 | August 31 | July 26 |
| Precipitation ${ }^{1}$ (average) | 12.63 (7.99) | 8.39 (8.24, Hawks Station) | 7.16 (10.7) |
| GDD ${ }^{2}$ (average) | 1008 (1093) | 1175 (1264) | 1758 (1738) |

## Selecting a variety

The malting barley industry in Michigan is still quite immature, leading to very few readily available varieties within the state. Collaborative research and Extension programs, such as the ESBN, have helped inform researchers at MSU, and have also led to varietal recommendations to in-state certified seed growers. Careful consideration must be made when selecting varieties, and one should not purchase a variety simply because "it's what's available". Keep in mind, craft brewers prefer 2-row varieties that have been bred specifically for malting. Maltsters, a barley grower's direct market, will prefer grain with $10-12 \%$ protein that has plump kernels and uniform germination with no evidence of sprout or DON.

Manage quality over quantity!

## Findings from the Field

Dr. Rich Horsley, North Dakota State University barley breeder since 1988, provides oversight and guidance across the entire ESBN project. He shares his observations on varietal performance specific to the eastern states, which market primarily to the craft beer industry.

## 2017 Agronomic Performance, and Barley and Malt Quality

Entries in the 2017 ESBN included 20 named varieties and five experimental lines from the NDSU breeding program. The named varieties included two from Canada, five from the U.S., four from France, and eight from Germany. The experimental NDSU lines were selected because of their moderate resistance to preharvest sprouting (PHS). In general, the varieties from Europe show some promise because of their superior resistance to PHS as compared to the two-rowed Canadian varieties AAC Synergy and Newdale; and the two-rowed NDSU varieties Conlon, Pinnacle, and ND Genesis. In general, the yield of the varieties developed in Europe varieties is competitive with the varieties developed in North America. The experimental lines 2ND33757 and 2ND33760 had yields comparable to AAC Synergy and ND Genesis.

As in previous years, a wide variation in resistance to PHS resistance was observed. Damage due to PHS is determined using the stirring number obtained from the Rapid Visco-Analyzer (RVA). Stirring number values less than 120 indicate that there is damage due to PHS. Resistance to PHS is going to be a major criterion on deciding which varieties to recommend for planting in the eastern U.S. Varieties with the best PHS resistance included the European varieties LCS Genie, KWS Fantex, Manta, and Acorn; and the six-rowed varieties Tradition and Quest. The varieties showing the most damage due to PHS included AAC Synergy, ConIon, ND Genesis, KWS Tinka, Bettina, and Newdale.

In general, the malt quality of the European varieties was superior to that of the six-rowed varieties, NDSU varieties, and experimental lines. The European varieties typically had higher malt extract and friability, and lower wort ß-glucan levels. Varieties showing promising malt quality included Sangria, Esma, and Bettina. However, Esma and Bettina also had greater damage to the barley due to PHS.
